

Project # 1

Kadie Johnstun

For this project, Kharmalina, Sharee, Rita and I created an inventory application for an assignment to show off our skills in coding up to this point.

Our application was web based and allowed a user to go on to navigate through an online store. Each item needed a name, description, price, category, and an image. The user needed to be able to view each individual item.

At first our site was very basic an we did very little in terms of styling as can be seen below.

Project # 1

Kadie Johnstun

As a team we were able to utilize post routes, bootstrap, forms and other coding essentials to get a better product and also make sure that we met and exceeded what was expected of us.

Code Highlights

```
const handleSubmit = async (event) => {
  event.preventDefault();
  try {
    const response = await fetch(`${apiURL}/items`, {
      method: "POST",
      headers: {
        'Content-Type': 'application/json'
      },
      body: JSON.stringify({
        title: title,
        price: price,
        description: description,
        category: category,
        image: image,
        rating: rating
      })
    });
    const data = await response.json();

    // console.log(data.title)
    // I need bottom code if not I have to manually ref
    // ! React expects a completely new value - I need to
    setItems([...items,
      data
    ]);

    setTitle("");
    setPrice("");
    setDescription("");
    setCategory("");
    setImage("");
    setRating("")

    setAddItems(false)
  } catch (err) {
    console.log("form error", err)
  }

  setAddItems(false)
}
```

```
// Post router
router.post("/", async (req, res) => {
  try {
    const item = await Item.create(req.body);
    res.send(item)
  } catch (err) {
    console.log('add error', err)
  }
});
```

One of the things that truly was hard for us to do on this project was to figure out GitHub and how it works as a team. We were able to figure that out first so that we did not step all over each other's toes as we continued to update the portion of code that we were each assigned to. After 68 commits we were able to come up with an amazing product for this project.

Here you can see our page on how to add an item.

Project # 1

Kadie Johnstun

This is a view of the cart after you had added other items to the cart.

In the end we were able to make a viable product that not only challenged us but also that was successful in creating an application that went beyond not only what was expected of us but also beyond what we expected of ourselves.
